

120 to 250 kHz Intermediate frequency amplifier with AGC

OVERVIEW

055TSMC_IFA_01 is an intermediate frequency amplifier (IFA) designed to amplify and transmit differential signals in the frequency range from 120kHz to 250kHz. The amplifier consists of two cascades, external gain control system, DC (voltage) offset compensation system, LDO and offset current block. The system of amplifying cascades provides the necessary gain and DC level of the signal. The AGC system provides a discrete gain change in the range from -10dB to +45dB and has a configurable operating mode (automatic, programmable and controlled via an analog output).
 IP technology: TSMC CMOS 55nm
 IP status: silicon proven
 Total area: 3.072 mm²
