

Phase frequency detector and charge pump

SPECIFICATION

1 FEATURES

- iHP SiGe BiCMOS 250 nm
- CMOS input signals
- Low disbalance of output current
- Minimum disbalance of the charging/discharge current in loop filter capacitors
- Portable to other technologies (upon request)

2 APPLICATION

- Phase-locked loop synthesizer

3 OVERVIEW

Phase-frequency detector (PFD) forms control signal for VCO tuning. PFD compares phases of divided VCO signal and divided reference oscillator signal and detects phase difference. Charge pump generates pulses to change VCO control voltage. The CP output stage is an amplifier equalizing a buffer reference voltage of CP output current: adjustment with a loop filter voltage; and an amplifier minimizing the disbalance of the charging/discharge current in loop filter capacitors.

The block is fabricated on iHP SiGe BiCMOS 250 nm technology.
